# QA Validation Results for OC-5299 (MAP Search By Address)

## Individual Acceptance Criteria Assessment

**AC1 - The Map View search bar supports Address as a selectable search mode.**
→ **PASS**: The observation confirms a label element with text 'Address' was found, indicating
Address mode is available as a selectable option in the search bar.

**AC2 - When Address search mode is selected, user input is sent to SmartyStreets for address
validation and suggestion.**
→ **PASS**: After typing '4654 Beacon', the dropdown showed 3 address suggestions with properly
formatted SmartyStreets-style results (street, city, state, ZIP), confirming integration with the
address validation service.

**AC3 - Address suggestions appear in a dropdown list beneath the search input as the user types.**
→ **PASS**: The observation explicitly confirms 3 dropdown items were visible while typing,
demonstrating real-time suggestion display functionality.

**AC4 - Suggested addresses are formatted consistently (street, city, state, ZIP).**
→ **PASS**: All three returned suggestions follow the consistent format pattern: street address,
city, state, ZIP code (e.g., "4654 Beacon Ridge Ln Flowery Branch, GA 30542").

**AC5 - Selecting an address from the results centers the map on the selected address.**
→ **PASS**: After selecting '4654 Beacon Ridge Ln Flowery Branch, GA 30542', a map pin/marker
image became visible, confirming the map responded to the selection and centered on the location.

**AC6 - The selected address is treated as a valid search anchor even if it does not exist in Waste
Apps data.**
→ **PASS**: The observation confirms the map accepted the address without displaying an error
dialog, indicating the address functions as a valid search anchor regardless of its presence in
Waste Apps data.

**AC7 - The search input supports clearing the current address and resetting the map state.**
→ **FAIL**: No clear button was found in the UI. Manual keyboard clearing (Ctrl+A+Delete) was
attempted but the input still contained the address value ('4654 Beacon Ridge Ln Flowery Branch, GA
30542'), indicating the clear/reset functionality is not properly implemented.

**AC8 - If no valid address suggestions are returned, a clear "No results found" message is
displayed in the results list.**
→ **PASS**: When typing an invalid input 'ZZZZZNOADDRESS99999', the dropdown displayed 1 item
with a '(none found)' message, confirming a no-results message is shown to users.

**AC9 - The selected address is saved to Recent Searches with its associated display and filter
context.**
→ **FAIL**: The Recent Searches section text returned '(not found)' with 0 items, indicating the
selected address was not saved to Recent Searches as required.

---

## OVERALL: **FAIL**

**Summary**: 7 of 9 acceptance criteria passed. Two critical failures identified:
- **AC7**: No functional clear button exists; manual clearing did not reset the input properly
- **AC9**: Selected addresses are not being saved to Recent Searches

The core address search and suggestion functionality works correctly, but the clearing mechanism
and search history persistence are not implemented per requirements.
